The diagram is a hierarchical funnel structure. At the top is a large cyan trapezoid labeled 'GLOBAL'. Below it are two yellow trapezoids, both labeled 'BRAND'. The left 'BRAND' trapezoid is further divided into three smaller yellow trapezoids: the top one is labeled 'APP', and the bottom one is labeled 'CAMPAIGN'. The right 'BRAND' trapezoid is divided into two smaller cyan trapezoids, both labeled 'APP'. Each of these 'APP' trapezoids is further divided into three even smaller trapezoids: the left one is yellow and labeled 'CAMPAIGN', and the right one is cyan and labeled 'APP'. The entire structure is set against a black background.

Color Naming Convention

This doesn't seem like much, but I hope it changes the way you think about selecting and using colors for design and building an interface.

Through years of building and designing interfaces, there is a common pattern that I have noticed with colors for the web. In addition, each brand that I have worked with usually has a primary and a secondary color (and, at times, a tertiary) in their brand color palette. From there, interfaces typically bring in those brand colors and have a series of other common colors across the interface.

Within my process one of the first things I do is to identify the color palette with the following: Primary, Secondary, (Tertiary,) Dark, Light, Accent. Then, identify variations of these colors with their own "dark", "light" and "accent" version.

For example, "**Primary**": "Primary Dark", "Primary Light", and "Primary Accent".

Identifying these colors as a "first step" in your design/development process creates the guidelines for consistency interface and prevents "designer error"/"developer error". These colors should be referenced and used throughout and you'll discover that working within these bounds saves you time while making design decisions.

Colors should be used as background, font, accents, etc. When using a color a background, I would recommend making a "contrast color" which is a color that does not compete with the background and can make your text legible (pass [WCAG 2.0 contrast ratio](#) success criteria).

It's been tested and it works by being flexibility to meet all my project's demands.

Colors should be used as background, font, accents, etc. When using a color a background, I would recommend making a "contrast color" which is a color that does not compete with the background and can make your text legible (pass [WCAG 2.0 contrast ratio](#) success criteria).

It's been tested and it works by being flexibility to meet all my project's demands.

• Dark - Darkest color in your palette

STYLE GUIDE CREATION

- Dark - Darkest color in your palette
- Light - Lightest color in your palette
- Accent - Highlight/Accent color to emphasize a part of the interface

- Dark - Dark color in the palette
- Dark Dark - Darkest color in the palette
- Dark Light - Lighter version of your dark color
- Dark Accent - Brighter/Highlighted version of your dark color

- Primary - Main color in your palette
- Primary Dark - Darker version of your main color
- Primary Light - Lighter version of your main color
- Primary Accent - Brighter/Highlighted version of your primary color
